ABSTRACT:

A method for treating an outdoor article, wherein a surface treating agent comprising a medium (B) containing a tetraalkoxysilane or a silane compound having a silanol group obtained by hydrolyzing an oligomer of such a tetraalkoxy silane (A), wherein the content of (A) is from 0.01 to 100 parts by weight per 100 parts by weight of (B), is used, and a thin film is formed by treating a hydrophobic synthetic resin coating film surface of the outdoor article with such a surface treating agent. It is thereby possible to prevent formation of a streak soils which are likely to form at a portion where rain water collects and runs down, such as below a window frame of a building.

ABSTRACT:

A method of producing decorative web from nonwoven polyester web includes heat setting the web at a temperature between 390 and 410 degrees Farenheit before applying a pigmented, solvent soluble, thermoplastic resin composition to at least one side of the web. The composition can include a polymer solution, which includes a vinyl polymer such as one or both of a polyvinyl chloride homopolymer resin and a polyvinyl chloride acetate copolymer resin, a solvent, plasticizers, heat stabilizers, light stabilizers, pigments and antistats. The composition also preferably may include fillers, soil repellents, and flame retardants. The composition is applied by a knife-over-roll apparatus, a rotogravure printer, or other conventional applicating apparatus. After the composition is applied, the web is passed through a hot air oven maintained at a temperature in the range of from about 230.degree. F. to about 330.degree. F. to dry the web of solvent and cure the composition to form solids in the web. The web can be embossed by passing the web through a conventional embossing apparatus that has been specially modified to include a backup roll to the embossing roll wherein the Shore A hardness of the backup roll is at least 90. The web so produced has a basis weight in the range of from about 3.5 ounces per square yard to about 15 ounces per square yard and includes cured composition solids which include a polyvinyl chloride/vinyl acetate copolymer resin, a polyvinyl chloride resin, plasticizers, stabilizers, antistats, and pigments. Applying standard commercial acceptance tests for louver material, the maximum shrinkage was 1/16", maximum stretch was 1/16", the maximum twist was 5 degrees, lightfastness was at least 200 hours, and no waviness, cupping, crocking or unacceptable mottling was observed.

ABSTRACT:

A method of treating a painted vehicle or glass to form a film which protects the surface and can be easily cleaned. A treatment solution including a surfactant mixed with water is rubbed into sections of the surface being protected until a tacky residue forms on the surface. The tacky residue is then rubbed into the surface until the surface is wiped free of any streaks.

ABSTRACT:

Aqueous-based basecoat compositions, useful for application to metal and/or plastic substrates, comprise an anionic polyurethane principal resin and an anionic acrylic pigment grind resin. The compositions are particularly adapted to application to substrates over a wide range of ambient humidities and have quick drying characteristics. The incorporation of an anionic acrylic grind resin, which is compatible with the anionic polyurethane principal resin, produces a coating which has good pigment wetting and dispersion characteristics with improved shelf life and color stability.
